

## Day-20

### Control Statement:

--- It is used to control the flow of execution.

#### Types:

### Conditional statement:

--- It is used to control the flow of execution based on conditions.

#### 1) Simple if:

--- It is a keyword which is used to check the condition and it will execute the statement block if the condition is True. It will ignore the statement block if the condition is False.

#### Syntax:

#### Flow diagram:

#### Programs:

```
#Simple if
```

```
#WAP to check whether the number is even.
```

```
'''
```

```
num=int(input('Enter the number: '))
if num%2==0:
    print(num,'is even')'''
```

```
#WAP to check whether string has exactly 5 characters in it .
```

```
'''
```

```
s=input('Enter the string: ')
if len(s)==5:
```

```

print(s,'has exactly 5 characters in it')"""

#WAP to check whether the number is greater than 200 .
"""
num=int(input('Enter the number: '))
if num>200:
    print(num,'is greater than 200')"""

#WAP to print the square of the number if the number is multiple of 3.
"""
num=int(input('Enter the number: '))
if num%3==0:
    print(num**2)"""

#WAP to check whether the character is Uppercase .
"""
s=input('Enter the character: ')
if 'A'<=s<='Z':
    print(s,'is uppercase')"""

```

## 2) if else:

--- It is an advance version of simple if. It will execute the True statement block if the condition is True. It will execute the False statement block if the condition is False.

### Syntax:

### Flow diagram:

### Programs:

```

#WAP to check the given data is float or not.
"""
data=eval(input('Enter the data: '))
if type(data)==float:
    print('given data is float')
else:
    print('given data is not float')"""

#WAP to check whether the string is palindrome or not
"""
s=input('Enter the string: ')
if s==s[::-1]:
    print(s,'is palindrome')
else:
    print(s,'is not palindrome')"""

#WAP to check whether the given character is vowel or not.
"""
s=input('Enter the character: ')
if s in 'aeiouAEIOU':
    print(s,'is vowel')
else:
    print(s,'is not vowel')"""

```

```
#WAP to check whether the given data is single valued datatype or not.
...
data=eval(input('Enter the data: '))
if type(data) in [int, float, complex, bool] :
    print(data,'is SVDT')
else:
    print(data,'is not SVDT')"""

...
data=eval(input('Enter the data: '))
if type(data) == int or type(data) == float or type(data) == complex or type(data) == bool:
    print(data,'is SVDT')
else:
    print(data,'is not SVDT')"""

```

#WAP to check whether the given integer is 3 digit number or not.

```
...
num = abs(int(input('Enter the number: ')))
if 100<=num<=999:
    print(num, 'is 3 digit number')
else:
    print(num,'is not 3 digit number')"""

```

- 3) **elif :** Whenever we want to check multiple condition and execute multiple statement block of each and every condition then elif is used.

#### Syntax:

```
if cond1:
    ↪ TSB1
elif cond2:
    ↪ TSB2
:
elif condn:
    ↪ TSBn
else:
    ↪ FSB
```

#### Flow Diagram:

#### Programs:

```
#elif

# WAP to find the relation between two integers.
...
num1=int(input('Enter the number1: '))
num2=int(input('Enter the number2: '))
if num1>num2:
```

```

    print(num1,'is greater')
elif num1<num2:
    print(num1,'is lesser')
else:
    print(num1,'is equal to',num2)"""

# WAP to check whether the character is uppercase or lowercase or digit or special characters.
"""
ch=input('Enter the character: ')
if 'A'<=ch<='Z':
    print(ch,'is uppercase')
elif 'a'<=ch<='z':
    print(ch,'is lowercase')
elif '0'<=ch<='9':
    print(ch,'is digit')
else:
    print(ch,'is special character")"""

# WAP to check whether the given integer is single digit or two digit or three digit or more than 3 digit
"""
num=abs(int(input('Enter the number: ')))
if 0<=num<=9:
    print('single digit')
elif 10<=num<=99:
    print('two digit')
elif 100<=num<=999:
    print('three digit')
elif num>999:
    print('more than 3 digit")"""

# WAP to find the greatest among 4 numbers
"""
a,b,c,d=int(input('Enter the num1: ')),int(input('Enter the num2: ')),int(input('Enter the num3: ')),int(input('Enter the num4: '))
if a>b and a>c and a>d:
    print(a,'is greatest')
elif b>a and b>c and b>d:
    print(b,'is greatest')
elif c>a and c>b and c>d:
    print(c,'is greatest')
else:
    print(d,'is greatest")"

```

#### 4) Nested if:

--- Whenever it is necessary to check a condition before another condition we use Nested if.

Or

Condition inside a condition is referred as Nested if.

#### Syntax:

```

if cond1:
    if cond2:
        ...
        if condn:
            TSBn
        else:
            FSBn
    else:
        FSBa
else:
    FSB1

```

#### Flow diagram:

*else:*  
    *FSB1*

## Programs:

#Nested if

#WAP to check whether the given character is vowel or consonant.

```

...
ch=input('Enter the character: ')
if 'a'<=ch<='z' or 'A'<=ch<='Z':
    if ch in 'aeiouAEIOU':
        print(ch,'is vowel')
    else:
        print(ch,'is consonant')
else:
    print(ch,'is not alphabet')"""
  
```

#WAP to login to the instagram by entering the proper username and password.

```

...
username='__seclusive__'
password='saku@123'
un=input('Enter your username: ')
if un == username:
    pw=input('Enter your password: ')
    if pw == password:
        print('Login Successful')
    else:
        print('Incorrect password')
else:
    print('Invalid username')"""
  
```

# WAP to find the greatest among three numbers.

```

...
a,b,c=int(input('Enter the num1: ')),int(input('Enter the num2: ')),int(input('Enter the num3: '))
if a>b:
    if a>c:
        print(a,'is greater')
    else:
        print(c,'is greater')
else:
    if b>c:
        print(b,'is greater')
    else:
        print(c,'is greater')"""
  
```

*a = 20  
b = 10  
c = 30*

*if a>b :     a > 10 ✓  
              a > c :     a > 30 X*

*print('a is greatest')*

*else:  
    print('c is greatest')*

*else:  
    if b>c :  
        print('b is greatest')  
    else:  
        print('c is greatest')*

## Assignment:

# WAP to find the greatest among four numbers.

## Day-21

### Looping Statement:

--- It is also used to control the flow of execution by executing the same set of instructions again and again.

### Types:

- **While loop**
- **For loop**

### 1) While loop:

--- It is used to execute the same set of instructions again and again until the condition become False.

**Note: There are 2 mandatory / compulsory things in while loop**

- Initialisation
  - Updation

## Syntax:

## **Flow Diagram:**

## **Programs:**

## # While loop

#WAP to print hello world for 5 times.

```
...  
print('hello world')  
print('hello world')  
print('hello world')  
print('hello world')  
print('hello world')
```

```
...  
i=1  
while i<=5:  
    print('hello world')  
    i=i+1
```

#WAP to print the n natural numbers

```
num = int(input('Enter the number: '))
i=1
while i<=num:
    print(i)
    i+=1'''
```

# WAP to print the even numbers from 1 to 30

```
num = int(input('Enter the number: '))
i=1
while i<=num:
    if i%2==0:
```

```

num = int(input('Enter the number: '))
i=1
while i<=num:
    if i%2==0:
        print(i)
    i+=1"""

num = int(input('Enter the number: '))
i=2
while i<=num:
    print(i)
    i=i+2"""

# WAP to print the number from n to 1.

$\text{out} = \text{out} + i$

$\text{out} = 0 + 1 \Rightarrow 1$

$\Rightarrow 1 + 2 \Rightarrow 3$

$3 + 3 \Rightarrow 6$

$i = 1$

$i = i + 1 \Rightarrow 2$

$\Rightarrow 2 + 1 \Rightarrow 3$

$3 + 1 \Rightarrow 4$

## Day-23

### Continuation of while loop programs,

# WAP to extract the integers from the list.

$\text{len}(l) = 5$

$l :> \text{len}(l) - 1$

$\text{tum}(i) = \text{int}(l[i])$

$\text{out} = \text{out} + \text{tum}(i)$

$i = i + 1$

```

# WAP to extract the integers from the list.
l = [2, 3, 24, 7+9j, 63, 'hello']
i = 0
out = []
while i < len(l):
    if type(l[i]) == int:
        out = out + [l[i]]
    i = i + 1
print(out)

```

$\text{len}(l) = 5$

i	$i < \text{len}(l)$ :	$\text{type}(i) == \text{int}$	$\text{out} = \text{out} + [l[i]]$	$i = i + 1$
0	$0 < 5 : \checkmark$	$l[0] == \text{int} X$	$\text{out} + [2]$	$i = 0 + 1 \Rightarrow 1$
1	$1 < 5 : \checkmark$	$l[1] == \text{int} \checkmark$	$[2] + [24]$	$i = 1 + 1 \Rightarrow 2$
2	$2 < 5 : \checkmark$	$l[2] == \text{int} X$	$[24]$	$i = 2 + 1 \Rightarrow 3$
3	$3 < 5 : \checkmark$	$l[3] == \text{int} \checkmark$	$[24] + [63]$	$i = 3 + 1 \Rightarrow 4$
4	$4 < 5 : \checkmark$	$l[4] == \text{int} X$	$[24, 63]$	$i = 4 + 1 \Rightarrow 5$
5	$5 < 5 : X$			

$$\text{out} = [24, 63]$$

### Practical proof:

```

l = eval(input('Enter the list: '))
i = 0
out = []
while i < len(l):
    if type(l[i]) == int:
        out = out + [l[i]]
    i = i + 1
print(out)

```

Or

```

l = eval(input('Enter the list: '))
i = 0
out = []
while i < len(l):
    if type(l[i]) == int:
        out.append(l[i])
    i = i + 1
print(out)

```

# WAP to extract uppercase, lowercase, digits and special characters separately into 4 different variables.

```

s = input('Enter the string: ')
uc = ''
lc = ''
dig = ''
sc = ''
i = 0
while i < len(s):
    if 'A' <= s[i] <= 'Z':
        uc = uc + s[i]
    elif 'a' <= s[i] <= 'z':
        lc = lc + s[i]
    elif '0' <= s[i] <= '9':
        dig = dig + s[i]
    else:
        sc = sc + s[i]
    i = i + 1
print(uc)
print(lc)
print(dig)
print(sc)

```

$i=0 \quad s[i] = 'S'$     $uc = uc + s[i]$     $i = i + 1 \Rightarrow 0 + 1 \Rightarrow 1$   
 $i=1 \quad s[i] = 'a'$     $uc = uc + s[i]$     $= 'U + 'S'$   
 $i=2 \quad s[i] = 'k'$     $uc = uc + s[i]$     $uc = 'S'$   
 $i=3 \quad s[i] = 's'$     $uc = uc + s[i]$     $i = i + 1 \Rightarrow 2 + 1 \Rightarrow 3$   
 $i=4 \quad s[i] = 'h'$     $uc = uc + s[i]$     $= 'U + 'S + 'K'$   
 $i=5 \quad s[i] = 'i'$     $uc = uc + s[i]$     $uc = 'U + 'S + 'K + 'A'$   
 $i=6 \quad s[i] = 'R'$     $uc = uc + s[i]$     $i = i + 1 \Rightarrow 5 + 1 \Rightarrow 6$   
 $i=7 \quad s[i] = '@'$     $lc = lc + s[i]$     $= 'U + 'S + 'K + 'A + 'R'$   
 $i=8 \quad s[i] = '1'$     $lc = lc + s[i]$     $lc = 'U + 'S + 'K + 'A + 'R + '@'$   
 $i=9 \quad s[i] = '2'$     $dig = dig + s[i]$     $i = i + 1 \Rightarrow 6 + 1 \Rightarrow 7$   
 $i=10 \quad s[i] = '3'$     $dig = dig + s[i]$     $= 'U + 'S + 'K + 'A + 'R + '@ + '1'$   
 $i=11 \quad s[i] = '4'$     $dig = dig + s[i]$     $dig = 'U + 'S + 'K + 'A + 'R + '@ + '1 + '2'$   
 $i=12 \quad s[i] = '$'$     $sc = sc + s[i]$     $i = i + 1 \Rightarrow 7 + 1 \Rightarrow 8$   
 $i=13 \quad s[i] = '^'$     $sc = sc + s[i]$     $= 'U + 'S + 'K + 'A + 'R + '@ + '1 + '2 + '$'$

```

print(uc)
print(lc)
print(dig)
print(sc)

```

$i=8 \quad s[8] = '1' \quad \text{dig} = \text{dig} + s[i]$   
 $= ' ' + '1'$   
 $= '@'$

### Output:

```

Enter the string: SakshiR@1234$^
SR
akshi
1234
@$^

```

# WAP to find the sum of integers in the tuple.

```

t = eval(input('Enter the tuple: '))
add = 0
i = 0
while i < len(t):
    if type(t[i]) == int:
        add = add + t[i]
    i = i + 1
print(add)

    i = i + 1
print(prod)

```

## **Output:**

Enter the list: [2.3,4.6,7.1,6.2,8.5]

28.52

4.6 \* 6.2

28.52

Enter the list: [True,4.6,7.1,6.2,2+3j,'gm',2.6]

28.52

## **Day-24**

### **For loop:**

--- It is self-iterative loop.

Drawback of while loop :

- It requires index position of the values in collection to traverse but set and dictionary won't support for indexing.
- Initialization , condition and updation are mandatory in while loop.

Advantage of for loop over while loop:

- No need of Initialization and updation.
- It can be used of all the collection datatypes.

**range():** It is used to create the sequence of integers between the given values.

Syntax:

```

range(SV, EV+1, updation)
range(SV, EV- 1, updation)

```

Range shortcuts:

- If updation == +1  
range(SV, EV+- 1)
- If SV == 0 and updation == +1  
range(EV+1)

Key points -- To print the range of values use typecasting.

```

range(1,10+1)
range(1, 11)
list[range(1, 11)]
list[range(1, 11)]
list(range(1, 11))
[1, 2, 3, 4, 5, 6, 7, 8, 9, 10]

```

## Syntax:

for var in collection:  
 ↪ S.B

## Flow diagram:

## Programs:

```

...
l = [10,20,30,40,50, 60]
for i in l:
    print(i)"""
